1. Disclaimer

This document contains detailed information about single telegrams which can be used to communicate with the device and configure it. Sending telegrams with malformed data or in unproper order can harm the device. So it is highly recommended to use the provided API for unexperienced users!

The telegrams are not guaranteed to remain unchanged in other/newer firmware versions. This means, that if you are using the telegrams you take the responsibilty to take care of changes introduced by firmware updates.

The CoLa protocol specifications allows referencing variables and methods by index - however, only access/invocation by name is available for this device!

When reading the CoLa specifications keep in mind that the device uses CoLa-2. For the calculation of the telegram checksum please refer to the provided python example.

2. General

2.1. Introduction

This document describes the functional interfaces of the Visionary-T Mini CX V3S105-1x device, 2.0.0.469R. The Visionary-T Mini CX V3S105-1x device is a SOPAS device. SOPAS devices may have Variables, Methods and Events.

2.2. User Level

Whether a Variable can be written or a Method can be executed by a user depends on the least user level. Defined user levels are:

ID	Name	Description
0	Always (Run)	Always (Run)
1	Operator	Operator
2	Maintenance	Maintenance
3	Authorised Client	Authorised Client
4	Service	Service

Table 1: User Levels

2.3. Variables

Variables can always be read and can only be written by a user with sufficient user level.

2.4. Methods

Methods can be invoked by using certain parameters. The method will return with a structure of one or more return values. If a Method can be invoked depends on the least user level.

2.5. Events

Events can be registered and will then be fired by the device to the registered client. Most Events have parameters which are the data coming with the Event.

2.6. Datatypes

All items of the interface have certain data elements. These are the Variables itself, the parameters of Methods and Events and the return values of the Methods.

The structure of the data elements can be one of the following BasicType(s), Structures or Arrays.

Basic Type

Name	Description	Range of values
Bool	boolean	True(1), False(0)
USInt	unsigned short (8 bit)	(0..255)
UInt	unsigned int (16 bit)	(0..65535)
UDInt	unsigned double int (32 bit)	(0..4294967295)

Name	Description	Range of values
ULInt	unsigned long int (64 bit)	(0..18446744073709551616)
SInt	signed short (8 bit)	(-128..127)
Int	signed int (16 bit)	(-32768..32767)
DInt	signed double int (32 bit)	(-2147483648..2147483647)
LInt	signed long int (64 bit)	(-9223372036854775808..9223372036854775807)
Real	IEEE-754 single precision (32 bit) (float)	See specification in IEEE-754
LReal	IEEE-754 single precision (64 bit) (double)	See specification in IEEE-754
Enum8	short enumeration (8 bit)	certain values defined in a list of choises (0-255)
Enum16	short enumeration (16 bit)	certain values defined in a list of choises (0-65535)
String	array of visible characters (array of 8 bit)	a character = an USInt with values between 0x20..0xFF
FlexString	array of visible characters with preeding current length (UInt lenght) (array of 8 bit)	See description of String and FlexArray
Byte	bitset definition (8 bit). Detailed specification of bits UInt1..UInt16 = UInt (1..16 bit) Int1..Int16 = Int (1..16 bit) Enum1..Enum16 = Enum16 (1..16 bit) Bool = Bool (1 bit)	value is transfered as an array of USInt. See "XByte Serialisation" document for further details on bit ordering
Word	bitset definition (16 bit), see description of Byte	value is transfered as an array of USInt see "XByte Serialisation" document for further details on bit ordering.
DWord	bitset definition (32 bit), see description of Byte	value is transfered as an array of USInt see "XByte Serialisation" document for further details on bit ordering.
LWord	bitset definition (64 bit), see description of Byte	value is transfered as an array of USInt see "XByte Serialisation" document for further details on bit ordering.
XByte	bitset definition (8,16,24,32,... bit) see description of Byte	value is transfered as an array of USInt see "XByte Serialisation" document for further details on bit ordering.
SCont	bitset definition (8 bit). Detailed specification of bits UInt1..UInt16 = UInt (1..16 bit) Int1..Int16 = Int (1..16 bit) Enum1..Enum16 = Enum16 (1..16 bit) Bool = Bool (1 bit)	value is transfered as USInt.
Cont	bitset definition (16 bit), see description of SCont	value is transfered as UInt.
DCont	bitset definition (32 bit), see description of SCont	value is transfered as UDInt.
LCont	bitset definition (64 bit), see description of SCont	value is transfered as ULInt.

Table 2: Basic Datatypes

Struct

A structure is a sequence of further types. These types can be of a BasicType, Structs again or an Array.

Array

An Array is a repetition of a type. The length of the array is defined with each Array. The types can be of a BasicType, a Struct or an Array again (n- dimensional).

Flex Array

A FlexArray is a repetition of a type with a variable length. The maximum length of the array is defined with each FlexArray. The current length of the FlexArray is transferred as a UInt preceeding the Array itself. The types can be of a BasicType, a Struct or an Array again (n- dimensional).

3. Measurement data

This chapter gathers all information about the used formats and issues with the data streaming.

3.1. Introduction

There are two types of data connections:

Streaming

The device sends out cyclic data; so called *blobs* (**b**inary **l**arge **o**bject**s**).

Control

Channel for acyclic control messages (read variables from device, invoke methods on the device, …).

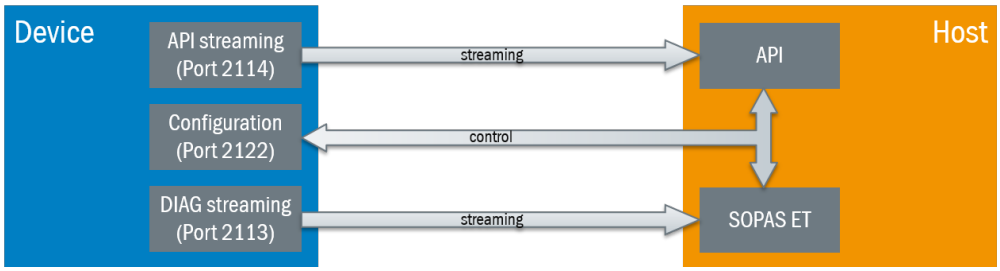

Figure 1. Connections with the device

The device provides a separation of the streaming into two channels via different ports.

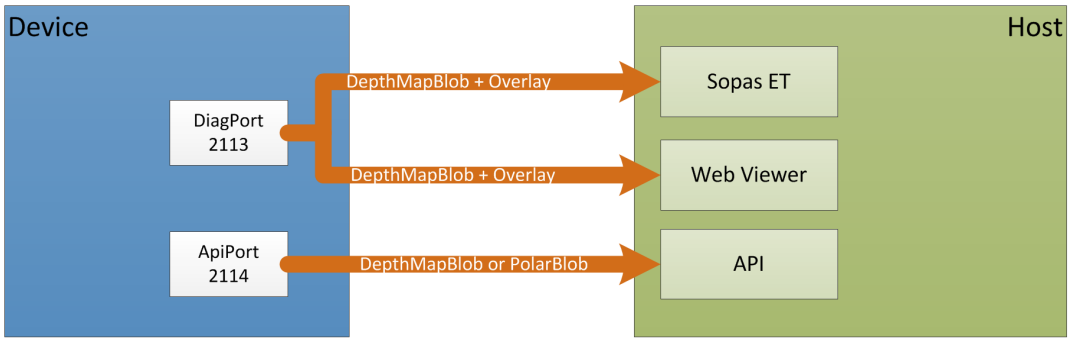

Figure 2. Streaming capabilities of the device

The diagnosis channel sends *depth map* frames containing distance, intensity and state maps. Those are complemented with visual overlays that support the diagnosis.

The API channel can be configured to send the intended data channels. Currently, only *depth map* data are supported.

The diagnostics data channel is used by Sopas ET. The ApiPort for the pure data transfer can be configured in the variable called BlobTcpPortAPI.

3.2. Blob format

A blob is formatted in a specific way that gathers all the needed information – see figure below:

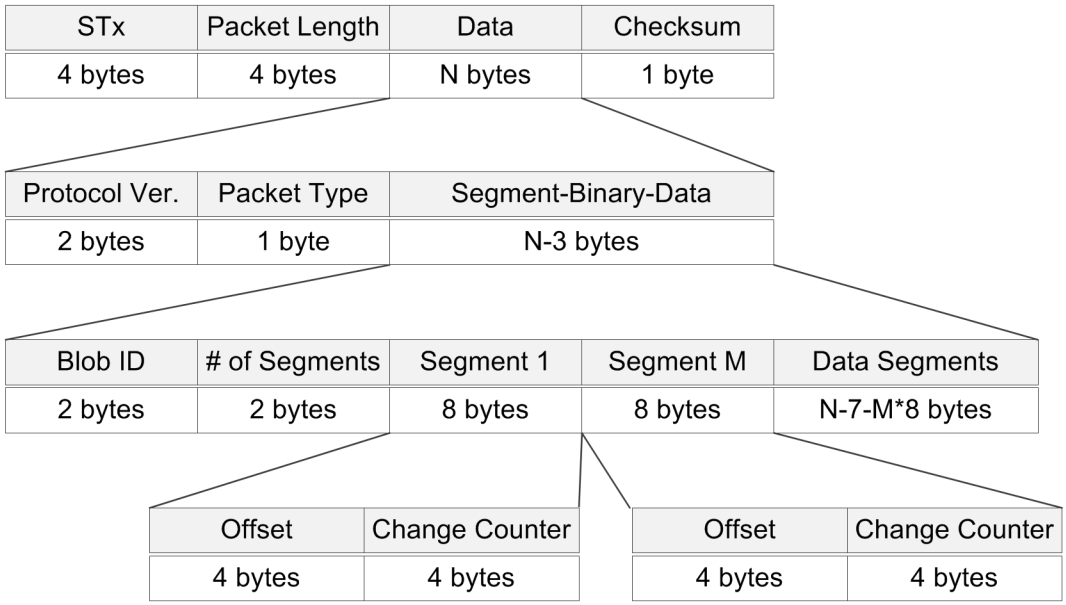

Figure 3. Blob structure overview

The following table describes the blob format items in detail:

Item Name	Description
STx	The framing header, always <0x02> <0x02> <0x02> <0x02>
Packet Length	The total number of bytes contained inside of Data
Data	Blob data without framing
Checksum	Not in use - Always <0x45>
Protocol Ver.	Always <0x00> <0x01>
Packet Type	Always <0x62>
Segment-Binary-Data	Blob data without Protocol Ver. and Packet Type
Blob ID	3D Data identification, always <0x00> <0x01>
# of Segments	The number of segments contained in this blob, M in this example
Segment 1..M	Each segment has its own 8 byte long description
Data Segments	Data Segments content (XML Metadata, Binary data and XML Overlays)
Offset	Defines where the segment data starts, counting begins after Packet Type
Change Counter	A counter value which will change if the segment content has changed

Figure 4. Items and description

3.3. Data Segments

We use the Blob ID = 1 and there are always the following three segments (in the given order):
1) XML metadata
2) Binary data
3) XML overlays

3.3.1. XML metadata

For how to extract the XML Metadata segment from the received data please refer to the Python example in *Data.py* and take a look inside the *Data.read()* method.

logging.debug("The whole XML segment:")
logging.debug(xmlSegment)

3.3.2. Binary data

This segment contains the binary measurement data as captured or computed by the device. For how to extract the measurement values from the binary data segment of the received data please refer to the Python example in *Data.py* and take a look inside the *Data.read()* method. For parsing the binary data itself please refer to the class *BinaryParser* in the same file. There you will also find how to extract the other data like version, frame number, data quality, device status, and so on.
The binary data is structured in several data sets (as specified in the XML metadata part) like shown in the next figure:

Dataset 1				**Dataset 2**			
Length = J	Data	CRC of Data	Length = J	Length = K	Data	CRC of Data	Length = K
4 Bytes	J – 8 Bytes	4 Bytes	4 Bytes	4 Bytes	K – 8 Bytes	4 Bytes	4 Bytes
	J Bytes				K Bytes		

Figure 5. Binary format: scans

Pitfalls

The timestamp is 64bit in an internal SICK format. See the code in the Python examples (in file Data.py method BinaryParser.logTimeStamp) how to extract date and time. Note that the devices do not contain a real time clock and hence the timestamp can only be used for relative comparisons.

Contrary to all other parts, the binary data (*Depthmap*) is delivered in little-endian.

3.3.3. XML overlays

The XML overlays are visualized in Sopas ET in order to support the device configuration. Hence, the XML overlay segment always contains an empty overlay for the *ApiPort*.

4.2.3. Variable: EMsgError

The following section contains a detailed description of the variable EMsgError.

Variable Overview

Variable Name	Description
EMsgError	Error message on level ERROR which is stored in non volatile memory (EEPROM) TODO: storing

Communication Name	MSerr
Read-Access	Always
Write-Access	No! (readonly)

Array	
Length	10
UserType	
ErrStructType	See the chapter "User Types" for details.

5.32. Type: CameraModel

The following section contains a detailed description of the user type CameraModel.

Type
CameraModel

Struct		
CameraID		Unique camera identifier
	FlexString	
	Length	0..64
ImageWidth		Image width for which the calibration is valid
	DInt	
	Value Range	-2147483648..2147483647
ImageHeight		Image height for which the calibration is valid
	DInt	
	Value Range	-2147483648..2147483647
FocalDistance		Distance from the camera to the plane of best image sharpness
	LReal	
	Value Range	See specification IEEE 754
FocalDistanceUnit		Focus distance unit (Default is mm)
	FlexString	
	Length	0..8

Struct		
IntrinsicK		3x3 matrix with the intrinsic camera parameters: K = [fx s cx, 0 fy cy, 0 0 1]
	UserType	
	Matrix3x3d	See the chapter "User Types" for details.
WorldToSensorDistortion		5x1 matrix with the world to sensor lens distortion coefficients [k1, k2, p1, p2, k3]
	UserType	
	Matrix5x1d	See the chapter "User Types" for details.
SensorToWorldDistortion		5x1 matrix with the sensor to world lens distortion coefficients [k1, k2, p1, p2, k3]
	UserType	
	Matrix5x1d	See the chapter "User Types" for details.
Transform3D		Rigid transformation from camera reference point to sensor coordinates [R,t]
	UserType	
	Matrix4x4d	See the chapter "User Types" for details.

5.33. Type: PowerMode

The following section contains a detailed description of the user type PowerMode.

Type
PowerMode

Struct			
mode			
	Enum8		
	Default Value	INVALID	
	Value	Name	Description
	0	INVALID	Power mode is not set
	1	OFF	Device is/was powered off
	2	SUSPENDED	Device is in a suspended mode, with a longer wake-up time
	3	STANDBY	Device is in a stand-by mode, that allows a fast wake-up
	4	CONNECTED_STANDBY	Device is in a stand-by mode, that keeps command communications up and running
	5	STREAMING_STANDBY	Device is in a stand-by mode, that keeps streaming data albeit without usable data
	6	ACTIVE	Device is up and running
